

# WinCAPS AutoTime

AutoTime provides a productivity boost for subtitle authoring, assisting with one of the most tedious and time-consuming parts of the job: timing text to the soundtrack. This optional software module for WinCAPS uses SysMedia's Speech Follower technology to align the text of one or more subtitles with the audio track to assign timecode values automatically.

The technique is best suited to video segments without intrusive music or sound effects, such as documentary style programmes for instance.

- Without AutoTime:**
- ▶ Play video, pause and shuttle to the desired start point
  - ▶ Capture in-time
  - ▶ Play video and listen to dialogue, pause video
  - ▶ Enter text (shuttle & capture out-time)
- With AutoTime:**
- ▶ Play video and select a good sequence of dialogue
  - ▶ Enter text and press the AutoTime key  
(video playback even pauses and resumes automatically for you)

AutoTime matches written text with the phonetics of spoken text in a short piece of audio and assigns subtitle timing accordingly.

The user can override the AutoTime process at any time - to assign timecodes manually in the conventional manner.

The language of the text and the audio must match each other. Languages currently available include English, Dutch, French, German, Italian and Spanish.

- **Faster timing**
- **Automated text-audio alignment**
- **Time-as-you-type**
- **Automatic video start/stop option**
- **Use with speech recognition for faster transcription**
